What is a Generalization?

Generalization is an essential component of the wider scientific process. In an ideal world, to test a hypothesis, you would sample an entire population. It is what allows researchers to take what they have learnt on a small scale and relate it more broadly to the bigger picture.

Association

An association defines a relationship between two entity objects based on common attributes. The relationship can be one-to-one or one-to-many; you can use two one-to-many associations to implement a many-to-many relationship. The association allows entity objects to access the data of other entity objects through a persistent reference.
